

ITAI-1371 - Intro to Machine Learning
Individual Contribution Journal

Camila Ferreira da Silva

For this group project, I completed the full Module 02 Lab notebook, working through all 16 cells and making sure the code, outputs, and visualizations were properly executed. I worked with the pandas, NumPy, and matplotlib exercises included in the lab and reviewed the notebook to ensure that the required tasks were completed and the results were displayed correctly.

As the Team Lead, I also organized the group's GitHub workflow and coordinated the final submission. I communicated the assignment requirements with the team, collected each member's contribution and reflection, organized the materials into the required group documents, and prepared the repository for the final submission. I also reviewed the repository structure to make sure the final version followed the professor's instructions.

Great Inioluwa Olayiwola

In this lab, I successfully loaded, preprocessed, and analyzed the classic Iris dataset using key Python data science libraries including pandas, NumPy, and matplotlib. I converted the raw dataset into a structured pandas DataFrame, computed summary statistics across flower species, and calculated feature metrics like sepal length mean and standard deviation using vectorized NumPy operations. To identify patterns visually, I created scatter plots showing species distribution across sepal dimensions as well as bar charts displaying class counts, resolving PDF layout and image-export challenges along the way

Quan Thach

I was responsible for importing the essential Python libraries (pandas, NumPy, Matplotlib, and scikit-learn) and loading and inspecting the Iris dataset features, target classes, and dimensions.
