

ITAI-1371 - Intro to Machine Learning
Individual Contribution Journal

Camila Ferreira da Silva

For this group project, I completed the full Module 02 Lab notebook, working through all 16 cells and making sure the code, outputs, and visualizations were properly executed. I worked with the pandas, NumPy, and matplotlib exercises included in the lab and reviewed the notebook to ensure that the required tasks were completed and the results were displayed correctly.

As the Team Lead, I also organized the group's GitHub workflow and coordinated the final submission. I communicated the assignment requirements with the team, collected each member's contribution and reflection, organized the materials into the required group documents, and prepared the repository for the final submission. I also reviewed the repository structure to make sure the final version followed the professor's instructions.

Great Inioluwa Olayiwola

In this lab, I successfully loaded, preprocessed, and analyzed the classic Iris dataset using key Python data science libraries including pandas, NumPy, and matplotlib. I converted the raw dataset into a structured pandas DataFrame, computed summary statistics across flower species, and calculated feature metrics like sepal length mean and standard deviation using vectorized NumPy operations. To identify patterns visually, I created scatter plots showing species distribution across sepal dimensions as well as bar charts displaying class counts, resolving PDF layout and image-export challenges along the way

Karima Sadruddin

My Individual Contributions

Area	My Individual Work
Notebook completion	Completed the Module 2 lab notebook and worked through the required cells.
Code execution	Ran the notebook cells and checked the resulting outputs for errors.
Data analysis	Worked with the lab's data-analysis exercises and reviewed the numerical results.
Visualization	Reviewed and verified the required visualizations and their displayed results.
Code documentation	Added helpful comments to explain important code and make the notebook easier to follow.
Testing	Re-ran the notebook work to check that the results were reproducible.
Reflection	Prepared my individual reflection about what I learned, challenges I encountered, and how my understanding developed.

Submission preparation	Prepared the notebook and PDF files using the required naming format for submission to the team lead.
------------------------	---

Individual Learning Contribution

My main contribution was completing and checking my portion of the Module 2 lab independently. I focused on understanding the code rather than only obtaining the expected outputs. I reviewed the results after running the cells, used comments to clarify important steps, and re-ran the notebook to make sure the work could be reproduced.

I also contributed by preparing my individual reflection and organizing my files so they can be provided to the team lead for the final team submission. This document represents only my own work and does not assign or describe contributions made by other team members.

Items Provided to Team Lead

- Completed Module 2 Jupyter notebook
- Completed notebook PDF
- Individual Reflection Journal PDF
- Individual Team Member Contribution Journal PDF

Note: The team lead will combine individual contribution information into the team's final contribution journal.

Quan Thach

I was responsible for importing the essential Python libraries (pandas, NumPy, Matplotlib, and scikit-learn) and loading and inspecting the Iris dataset features, target classes, and dimensions.
