

Contribution Journal

In this lab, I successfully loaded, preprocessed, and analyzed the classic Iris dataset using key Python data science libraries including pandas, NumPy, and matplotlib. I converted the raw dataset into a structured pandas DataFrame, computed summary statistics across flower species, and calculated feature metrics like sepal length mean and standard deviation using vectorized NumPy operations. To identify patterns visually, I created scatter plots showing species distribution across sepal dimensions as well as bar charts displaying class counts, resolving PDF layout and image-export challenges along the way.
